It's common for a student who has made a log entry in one program but wants to edit his image in another. The beginner's best option is using one of the photo-editing programs that includes the tools and features that a beginning photographer wants. For example, Blur Studio is a free program, but Photogene is a small but comprehensive program. Digital camera printers The digital camera has revolutionized photography and has changed the way that photographers make images. Before a digital camera, images were taken in film and developed in the darkroom. Now, using a digital camera, you can take a perfect picture almost instantly on your LCD monitor, and even alter the way that images are later printed by your printer. Digital cameras vary in their features, cost, and image quality, but they all produce digital files that can be exchanged in the standard formats used by most editing programs, including Adobe Photoshop. In this chapter, I introduce you to the basics of digital photography and help you get the best from your digital camera's LCD screen. Determining the Features of Your Digital Camera Digital cameras come in many sizes, but you need to consider what size is best for your style of photography. As a new beginner, I have found the following to be the most useful sizes for the purpose of this book: Full-size SLR: These cameras are the larger, heavier versions of the point-and-shoot cameras discussed in the previous chapter. They typically have a DSLR mount and a large LCD monitor. They are also known as dSLRs. Digital point-and-shoot: These cameras don't have a DSLR mount. Instead, they use a 1/2.3" or 1/3.5" CMOS sensor and a vari-focal lens to make images. These are not particularly large or heavy, but the lenses are small, meaning that focusing the image can be difficult and there is a limit to the smallest lens size that the lens can cover. Micro four-thirds: These cameras are small, lightweight, and easy to use. They are somewhat unusual in that they use a 1/2.8" CCD sensor and a lens ranging from 1.7 to 2.3 mm, which creates a much smaller file size than in other types of cameras. These size lenses are also less likely to blur the image when focused. Four-thirds: This type of camera has a

How To Use a Brush Tool In Photoshop, there are two types of brushes you can use to achieve your desired look: natural-looking and non-natural. Non-natural brushes have one of four different types of fills: Stroke, Glow, Radial, and Gaussian. A stroking brush is used to create strokes. You can set the stroke's diameter, color, opacity, and hardness. A glow brush creates a glow effect on your stroke. You can choose its diameter, color, and Opacity. The highlight comes from using a Stroke. The radial brush uses a single point for creating a circular shape. Choose a color, size, and Opacity. The Gaussian brush creates a "blobby" effect. Choose a color, size, and Opacity. The best way to use the Gaussian brush is to choose one or two points to create an even blobby effect. Tips You can change the stroke and glow colors from the Stroke and Glow palettes. You can change the brush size by right-clicking on your stroke or glow and clicking Edit Brush Size. Permanently Saving a Brush To save your brushes, you have two options: one for Photoshop CS6 and one for Photoshop CC. For Photoshop CS6, the tool palette option is located in the Brush Panel's Brush Menu. Click the Filled Brush button in the Brush Panel, and then choose Save Brush from the panel menu. In the Save Brush panel, fill out the settings and click Save. For Photoshop CC, the brush settings are located in the Brush panel's Brush menu. Click the New Brush button, then choose Save Brush from the brush menu. In the Save Brush dialog box, fill out the settings, and click Save. Tips For more information, click here. Using the Paint Bucket Tool The Paint Bucket tool's main purpose is to select an area of an image and then paste the contents of a different file or an existing layer into that image. As a result, you get a pixelated pattern or paint dripping from one area of the image to the other. How To Use the Paint Bucket Tool Here are three ways you can use the Paint Bucket: Select a region, such as a face To select an area, drag your cursor over the area and make sure you have it in a group. For example, click to put your cursor over the area, and then click again to put your cursor into a group.

I have a responsive website, with each page is made using media queries, each page has an HTML5 video element that plays by itself and works perfectly, but when I include this video on a page, the loading time of the video is much longer than it should be, it takes about 2 seconds to start. To make sure this is not a path issue, I've tried using a video on my desktop which works just fine. A: You should use the webkit video element rather than the regular HTML video tag.
